

OEHS SUPPORT SERVICES

Program Assessment and Technical Support

Our experts provide a comprehensive assessment of organizational OEHS programs utilizing tailored protocols that have been aligned with global OEHS management standards. The assessment process can be carried out at the Corporate, Business Unit/Division, or Facility level and provides an overall picture of the site strengths and weaknesses relative to established OEHS management standards and best practices. The assessment can be tailored to meet the organization's needs; from a basic assessment report to detailed plans including the technical support necessary for correcting those OEHS program gaps identified.

Health & Safety Programs (HASP's)

- * Rapidly Assess OEHS Programs
- * Align Programs w/Industry Practices
- * Audit Against Standards (ISO/OHSAS)
- * Establish Management Principles
- * Identify Gaps/Risks Across the System
- * Develop Corrective Action Plans

The assessment is the first step in building a strong, sustainable OEHS program. Weaknesses identified during these evaluations are rated against good industry practices to assign relative risk while allowing for prioritization of corrective actions. Our experts also provide the support services necessary to assist an organization with developing detailed recommendations and corrective action plans. Thereafter, we lend our experts toward supporting the execution of any remediation plans which result.

We recognize that some organizations may require supplemental technical support to bring their OEHS programs to the level necessary for conformance with legal and company requirements or standards, such as:

- ⇒ Environmental support to assure that the organization has identified its environmental impacts, legal requirements, etc. and has adequate management plans and programs in place to ensure compliance with industrial regulations and good practices involving environmental stewardship.
- ⇒ Validation systems, designed to authenticate the organization's characterization of workplace health hazards and to confirm that worker exposure to hazardous chemicals is being managed.
- ⇒ Medical management and occupational health experts to assure that adequate controls are in place to provide monitoring and protect worker health.
- ⇒ Safety support to assure that the organization has assessed workplace safety hazards and has adequate controls, procedures and training in place to protect workers.
